

Pulse Intelligence Platform

Interface Wireframe & Navigation Flow Specification

This document provides the schematic wireframe design and user interaction specification for the Pulse Intelligence platform, evolved from the original Weekly Product Review Pulse project. The system separates dashboard controls, ingestion diagnostics, deep-dive strategy analyses, and evidence verification boards to ensure FAANG-quality user experience and maintainable architecture.

1. Dashboard (Overview) Mockup & Layout

The main overview panel holds all ingestion controls directly at the top of the interface (satisfying the strategy/Ingestion control proximity requirement). It exposes app selection, date range adjustments, and the primary 'Launch Ingestion' action. The lower area renders the asynchronous log output block in real-time, showing pipeline stages like scraper status, semantic deduplication, and quality filter counts.

2. Insights Hub Mockup & Layout

The Insights Hub visualizes aggregated data coverage and sentiment metrics. It breaks down signals across Play Store, App Store, and Reddit channels, and displays the distribution of sentiment. Below the charts, it displays the principal AI-detected user themes, exploration barriers, and quotes rejected by guardrails (minimizing hallucinated data).

3. Strategy Hub & Case Study Mockup

The Strategy Hub hosts the 16-step Principal PM Framework. It uses a sidebar index layout to switch between framework steps dynamically without page reloads. The main panel renders the active step details, prototypes, success metrics, and exposes single-click actions to generate extended Executive Presentations (Slides API) or Product Requirement Documents (PRDs).

4. Signals Hub & Raw Review Board Mockup

The Signals Hub allows product managers to verify the source evidence backing the strategy case study. It presents all ingested and normalized reviews alongside their classification scores (Gold Insight, High Signal, Medium Signal, Discard). It provides clear options to search and filter records, drill down into original comments, and audit the AI quality classification.
